MyCode like this:

```
String stemp  = "{{5000:5000h1; [s0; ]:: [s0; ]:: [s0; ]:: [s0; ]}}";
RichText x = ParseQTF(stemp);
RichTxt celltxt = x.GetTable(1).GetPick(1,1);
```

but in Txt.h
   const RichTable&   GetTable(int i) const;
so i can't edit text in tablecell.

Could someone please tell me how to eidt RichTable int RichText?

Thank you in advance

ihope

Well, generally, I mostly use QTF to define RichText content.

Anyway, you can of course manipulate it directly (not quite documented at the moment...

Table manipulation routines are in RichText, starting with GetTableFormat method. All tables are accessed by table index, starting from zero. You can transform editation position to table index (to find out in what table cursor is) using RichPos structure, which contains a lot of related info...

thanks.

   i made it. i changed the source code to return a reference to RichTable without const .

Not a good idea, your code will be broken with next U++ version.

If RichEdit can do tables with current RichText interface, you can do it too

U++ is the best C++ platform, i think.

i can GetTableFormat ofcourse , but RichTable::Format cannt help me to manipulate RichCell . perhaps, without enough document, i cann't understand your suggestion way .

Sorry for lacking documentation... In fact, you are not even supposed to work with RichCell that is already in RichText.

What exactly have you planned to do with the table?

i stored person's information (include photo) into DB, then i get photo from DB and insert it into QTF(here i used QTF as a template). in another word, i used UWord as a simple user interface.   i test this just for interest .

Using QTF as template is now about 80% of my job

But I am doing it mostly on QTF level.
