Subject: Can't get rid of minimize button on Linux, okay on Win32

I moved code from Win32 to Linux and everything worked.

However, the Linux top window has an extra button - minimize. I cannot seem to get rid of it by any means. In the constructor of the class that inherits from TopWindow, the following does not get rid of the extra button:

```
MinimizeBox(false);
```

Any suggestions?

(openSuSE 10.2 is the platform that I'm on).

This isn't yet implemented for X11.

There is a bit work left with X window manager hint support.

Trivial to do, though.

Guido

Interesting, did not know it is even possible...
