Actually, it was just ASSERT (thread has to opened), no problem in release mode.

Maybe this one will satisfy You, it does real job.  
Probably name should be changed from thread example to fractal explorer.

I was not able to get it to build (multiple errors). Most likely problem is that I am running an incompatible version of UPP (currently version 2007.1 on gentoo linux)...

What version and OS did you develop and run on?

The code looks clean enough on first read that I vote this to be added as one of the distributed example (if appropriate, etc.)

Well, I guess it will counter the efforts a bit, but I am thinking about adding it after converting it to CoWork (and perhaps improving a bit too).

I use Current, I'm not using 2007.1 at all at the moment.  
Hoever i didn't check it on BSD with gcc, and will not because u++ team member dont want this  
ex. in U++ so there is no reason.

luzr wrote on Tue, 26 June 2007 20:55but I am thinking about adding it after converting it to  
CoWork

The purpose was to show How use Threads by "hand" without CoWork, in the different way, that  
allows programer by hand manage entire Thread use in App.

CoWorker in U++ , BackgroundWorker in NET all are good but sometimes there are more  
compiled program designs wich prohibit use os such High level tools.

That is OK. OTOH, I guess we already have an example how to do MT applications (without  
CoWork) - GuiMT. This one would nicely fill the need of CoWork demonstration (which is IMO  
missing a bit more right now).

In fact, the needed change is quite minimal, about 10 lines are deleted and one added

Of course, it is your code, I will not alter/add without your permission

With CoWork my Process() will put all cb into the CoWork queue so I will not know which are active at the moment, and this is traced in app.  
So probably this is not convertible to CoWork without losing some functionality.

---

---

I bit corrected to look nicer but without CoWork.  
Allow changing threads count, rows, cols, iterations shows time etc.

I think GuiMT is better candidate for CoWork.

Current src below.

Yep i checked in 2007.1 there is not Mutex (but this is no problem)  
There are unresolved symbols with Semaphore and Thread classes.

in current upp there are no problems.

Well, it is not.

CoWork is intended as a tool for simple loop paralelization. There is no loop in GuiMT....

I bit extened:

- More factal sets
- Logarythmic color scale
- one rendering method for all fractals
- fractal calculating methods are callbacks for thread rendering methods
- left down + mouse move , moves the fractal
- left down + CTRL + mouse move selects area for zoom
- axis describing complex area

Starts to look really nice. It is not an example I am searching for 'reference', but it is now very nice demonstration example...

BTW, Rect\_<double> is 'Rectf'. Rect\_, Point\_, Size\_ were introduced only as implementation technique for Point, Point16, Pointf etc...

BUG: When moving the area, if you move the mouse outside the view, it gets "stuck" and continues moving even if mouse button is released...

Instead of 'moving' flag, use SetCapture and IsCapture.

You might also try to make the program structure a little bit less complex, I have noticed the troubles you have with routing mouse messages.

One option is to "reverse" class-member and widget-parent-child relations. In U++, you can easily contain the main window IN the child ctrl class:

```
struct Threads : Ctrl {
    TopWindow win;

    void Paint(...);
    void LeftDown(...);

    Threads() { win.Add(*this); ... }
};
```

This would significantly reduce the number of line in the example (I think).

[/quote]

I don't have troubles, i jut follow familiar for me .NET rules of connecting events, and similar to Qt. Control got events which can be connected, thats all.

I didn't use such techniques of letting sub control owning entire window. It don't looks good for me.

---

Control owns window, window contains control which contains this window. Circular dependency ?

What in case when window got multiple controls and we want to connect many events ?

That is just mind barrier, believe me. The key to understand is that class containment does not have to be related to the GUI containment.

Quote:

I think "got" is a wrong word here.... Sure, nothing prevents you to follow GUI in class composition, but in U++ it is not requirement.

Before going deep into philosophic details, "inverse layout" in your example would very likely produce much less complex code - which is the thing I am usually pursuing...

arturbac wrote on Sun, 01 July 2007 17:53Ok.

Btw the Format example is not finished, i don't know how to format double value with strict number of decimal places.

[http://www.ultimatepp.org/src\\$Core\\$Format\\$en-us.html](http://www.ultimatepp.org/src$Core$Format$en-us.html)

Quote:  
printf formatters

Most printf formatters are supported:

c d i o x X l d l i l o l x l X e E f g G s

Please refer to printf documentation for the description.

Some more \*user\* notes about the example:

- option to remove the ruler
- mouse click / Ctrl should be IMO swapped (move with Ctrl, select without)
- 'go back' button

arturbac wrote on Tue, 17 July 2007 05:44:1. 2007.1 is to old i tested it with current u++ in SVN on sourceforge

2. Mingw doesn't have SSE2 intrinsics , (gcc & msvc have) comment out USE\_SSE2 in ThreadFractRend.h

You can add `#if defined(COMPILER_GCC) && defined(PLATFORM_WIN32)` too..

this is useful, though it does not show everything i need about thread, like terminating one and  
communications b/t threads.  
thans anyway

1.Terminating - wrong idea (becouse of allocated resources by threads)  
Telling thread to stop via some variable - is good idea  
2. Comunicating betwen threads for example with ThreadSafeQueue  
when one thread do somting for other thread

Will think about changing the example in the future for use with ThreadSafeQueue...

where is ThreadSafeQueue? not in U++ or your example?  
it seems i can use select(). but i still don't know how to put this kind of queue or sth. together with  
a SOCKET into fd\_set

I will put here my fresh one however this [C++] implementation is not tested, but Same Generic in C# works well.

[Im at porting stage of some app to c++ so why it is stil not tested]

```
template <typename T>
class ThreadSafeQueue
{
    class QueueElement;
public :

    int    GetCount() const;
    void    Enqueue(T value);
    T      Dequeue();
    void    FinishWaiting(bool end_job);

    ThreadSafeQueue();
    ~ThreadSafeQueue();

private:
    int      m_count;
    QueueElement *  m_head;
    QueueElement *  m_tail;
    Threading::Monitor m_monitor;
    Threading::CriticalSection m_lock;
    bool      m_finish_wait;

    class QueueElement
    {
    private:
        friend class ThreadSafeQueue;

        T      m_value;
        QueueElement *  m_next;

        T      GetValue() const;

        QueueElement(const T & value);
    };
};

template <typename T>
int ThreadSafeQueue<T>::GetCount() const
{
```

```

    return this->m_count;
}

template <typename T>
ThreadSafeQueue<T>::ThreadSafeQueue()
: m_head(NULL)
, m_finish_wait(false)
, m_tail(NULL)
, m_count(0)
{}

template <typename T>
ThreadSafeQueue<T>::~ThreadSafeQueue()
{
    m_lock.Enter();
    //Cleanup remaining items
    if (this->m_head != NULL)
    {
        QueueElement *p = this->m_head, *pdel;
        while (p != NULL)
        {
            pdel = p;
            p = p->m_next;
            delete pdel;
        }
        this->m_head = NULL;
        this->m_tail = NULL;
    }
    m_lock.Leave();
}

template <typename T>
void ThreadSafeQueue<T>::Enqueue(T value)
{
    m_lock.Enter();
    {
        m_count++;
        QueueElement *enqueue = new QueueElement(value);
        if (m_head == NULL)
        {
            m_head = enqueue;
            m_monitor.Pulse();
        }
        else
            m_tail->m_next = enqueue;
        m_tail = enqueue;
    }
    m_lock.Leave();
}

template <typename T>

```

```

T ThreadSafeQueue<T>::Dequeue()
{
    QueueElement *dequeued;
    m_lock.Enter();
    {
        while (m_head == NULL && !m_finish_wait)
            m_monitor.Wait();
        if (m_head == NULL && m_finish_wait)
        {
            m_lock.Leave();
            return T(); //End
        }
        m_count--;
        dequeued = m_head;
        m_head = m_head->m_next;
    }
    m_lock.Leave();
    T res(dequeued->GetValue());
    delete dequeued;
    return res;
}

template <typename T>
void ThreadSafeQueue<T>::FinishWaiting(bool end_job)
{
    m_lock.Enter();
    {
        m_finish_wait = end_job;
        m_monitor.Pulse();
    }
    m_lock.Leave();
}

template <typename T>
ThreadSafeQueue<T>::QueueElement::QueueElement(const T & value)
: m_next(NULL)
, m_value(value)
{}

template <typename T>
T ThreadSafeQueue<T>::QueueElement::GetValue() const
{
    return this->m_value;
}

class Monitor : public CriticalSection
{

```

public:

Monitor();

void Wait() throw(...);  
void Pulse() throw(...);

private:

int m\_QueueSize;  
CriticalSection m\_lock;  
Semaphore m\_waiting;  
};

Monitor::Monitor() : m\_QueueSize(0) {}

void Monitor::Wait()

{  
m\_lock.Enter();  
m\_QueueSize++;  
m\_lock.Leave();  
m\_waiting.Wait();  
}

void Monitor::Pulse()

{  
m\_lock.Enter();  
if (m\_QueueSize > 0)  
m\_waiting.Release();  
m\_lock.Leave();  
}

i seriously need some advice how to implement my project.

a UDP client. interface is a thread i suppose. & i'd like my client to run in a thread. thus, i donno how to communicate b/t them. in my thread, i need to watch both the network socket and something between UI. if linux, i can select(), but in U++, what? i plan to use a std::queue which UI writes and my thread reads and this still seems not so fit into U++.  
any suggestions? thank you very much

Why do not you just use "select" ?

Mirek

i prefer Win32 programming. so i suppose WaitForSingleObject or sth. should be what I need. since i never win32 programmed before, i have trouble here. if i both WSASStartup and select(), i suppose it is a mix of styles and thus puzzling.

Anyway, as a last resort, select() is acceptable for me, too. however in this case, i don't know how to inter-thread communicate using select() since i need to communicate using SOCKET
