Hi there,

just hacking again and having 2 questions regarding gridctrl:

How can I call a function if the selection changed. In each row I have a filename of an image and on selecting a row I will show the image above the table.

Is it possible to add 2 pointers to the toolbar (up and down) to move the actual selected row.

Thanks

Heli

Ok, just solved my first problem by reading topic++

```
config_.WhenChangeRow = THISBACK(ShowImage);
```

does it. Just in topic++ is a little error: there is written WhenRowChange...

Bye

Heli
