Subject: How to work with other compilers (e. g.: Borland Turbo or Builder, DigitalMars, DJGPP, OpenWatcom)

Hello!

U++ has a really good point against others GUI and IDE.

But, i wish to know how to work with other compilers, despite the MSVC8 and GNUMinGW implementations.

If exist any suggest or idea, all of them are welcome!

thanks!

Here's the little I know about working with other compilers...

The only thing I've found in the documentation so far is this
  http://www.ultimatepp.org/appideConfiguringPackagesAssembl ies$en-us.html

Custom Build Steps and Building packages from an ESC macro section ans

In this thread they talk about Digital Mars [in]compatibility with Upp

  http://www.ultimatepp.org/forum/index.php?t=msg&goto=692 3

Ciao,
David

You would need to add "builder" code for particular compilers, or create build script.

Anyway, the real problem is that there is only a little reason to do so. Supported compilers are free
and good (C++ compliant).

There are no other C++ compilers on linux or Mac OS X. On windows, you could consider using
Borland, Watcom or Digital Mars. Unfortunately, a couple of years ago they were not good enough
to compile U++.

AFAIK, there are recent efforts to revive Digital Mars support. We will see how that goes...

Mirek

?????

Waht about LLVM http://llvm.org/? Seems very promising to me. It has a number of nice features:

-written in C++, heavy use of STL (it's always better than no templates at all   )
-As the name suggests, it can work as a Virtual Machine on produced RISC-like virtual code (it's

the equivalent of GCC RTL)
-offers support to run-time and off-line optimizations based on code profiling
-there's a lot of documentation
-currently builds large projects such as mozilla and Qt
-Is sponsored by Apple
-its licence is bsd-like

drawbacks:
-currently uses GCC as Front End to parse C and C++ files. translating results into LLVM assembly.
-as a consequence of previous point, LLVM front end licence is the the same as gcc (GPL)

good news:
a fast new C front-end is under-way.. It is quite complete, C++ and ObjC support will follow (but time is needed, of course)
look at
 http://lists.cs.uiuc.edu/pipermail/llvmdev/2007-July/009817. html

Ciao,
David
