How to set transparency level for static rectangle or other controls?

I have this code(one rect semi-covers the other):

```
#include <CtrlLib/CtrlLib.h>
```

```
GUI_APP_MAIN
```

```
{  
    TopWindow w;  
    Array<StaticRect> fr;  
  
    fr.Add();  
    fr[0].SetRect(50,50,100,100);  
    fr[0].Color(SRed);  
    fr.Add();  
    fr[1].SetRect(100,100,100,100);  
    fr[1].Color(SBlue);
```

```
  
    w.Add(fr[0]);  
    w.Add(fr[1]);
```

```
  
    w.Run();  
}
```

```
SetColor(NULL);  
Transparent();
```

Not that "Transparent" is in fact just painting hint - in theory, all would work with this flag ON for all Ctrls. However, to avoid flickering, only Ctrls that really are transparent should have this activated.

Also, if what you need is StaticRect that is always transparent, rather use ParentCtrl.

Where is THE LEVEL? I can't see any numbers.

I want:

SetColor(SRed, alpha=50%);

I see... Well, alpha-blended drawing is not supported.

You can SetAlpha for top-level Ctrl - it it will work on WinXP, but that is all for the moment.

(The problem is that alpha-blending is not supported by base platforms).

do you suggest to use primitive DC and bitblt?

Actually, what I suggest is that DC/BitBlt (and its X11 equivalents) do not support alpha-blending (AFAIK).

However, it is possible that I misunderstood what you really need...

What kind of operation do you want to do with BitBlt?

I'd like this kind

also you can check more at:

Well, you can have this: it is window-level alpha blending, supported by `Ctrl::SetAlpha`.

The only problem you have to be aware of is that unlike all other things, you can use `SetAlpha` just for windows that are open at the moment (this is not U++ way, perhaps I should fix that..)

Try (untested):

```
GUI_APP_MAIN
{
    TopWindow win;
    win.Open();
    win.SetAlpha(100);
    win.Run();
}
```

Another thing to know is that it does not work before Win2000 or in Linux (is NOP).

BTW, what you cannot have is alpha blending of shapes in your view area (this requires GDI+ on Win32, which is not implicit on all platforms we want to support...)

Yes, it is working. My mistake was that I had missed win.Open().

Then, experimenting with U++ Ctrl DC's, I realised that in U++ you get hwnd after you open the window.

But now I can't believe that the semi-transparent window is soooo slow comparing to what I get with "pure" win32 API's on my 1.5 Ghz. Could you give some hints about the reason?

Mirek

Actually, I want to use not only bitblt but I need hDC's for win32 api's, like SetDIBitsToDevice, StretchDIBits, AlphaBlend etc.

There was something strange... It's ok now after I recompiled.
