Im using Core in Core/WTL/GDI+ mixed project in MSVC8
I had to remove line in Util.cpp

include <intrin.h> because i had errors about second C linkage

defines as follow

```
_DEBUG  
WIN32  
WIN64  
_WINDOWS  
_AMD64_  
_WIN64  
flagWIN32  
flagMT
```

We have this there because of _debugbreak, right?

The problem is because the /Oi switch ...
So when /Oi is enabled at compile time the linker knows all the function from this include and tries to include them again or something.

Well, anyway, I wanted to say:

If I remove that include, what happens to _debugbreak on win64?

with /Oi propably nothing (i will check)
Without /Oi error

But i don't know how to test if /Oi is enabled.

Means you suggest to add another #ifdef for Win64?

This doesn't depend on WIn ver, this depends on compile time options passed to compiler

Well, that is nice to know.

However, I am still not sure what to do with that damned file and include...

Mirek
