Subject: Altered build process - error marks postoponed after build finished

Recently I become dissatisfied with build speed in cases when most or all things are up-to-date. Just listing of all ide packages without any compiling on my desktop took nearly 2.5s.

Investigating the issue, I have found the cause to be call of "SetErrorEditor();" call after the build of each package (this is supposed to mark errors in the current file).

I have "fixed" the issue by simply removing this call, leaving just one after all building is finished.

Thanks,

I still think It would be better to remove my halfe baken markers with the remove markers patch I submitted sometime, ago.
I would still like to have these kind of markers, unfortunatel I still see no simple way to fix all the problems they have with the current architecture.

Perhaps I will give it another try in the future. But currently I use my spare time on a layout manager and related to this to the "GetMinSize", "GetStdSize" patch...

- Ralf

Hi Zardos.
I know you wanted me to remove them, but I got used to it for good  I think current version is ok even if it doesn't fully support undo operation.
