Subject: How to resize TabCtrl?

Hi there,

Ok so TabCtrl resizes just fine but the child controls in a tab layout do not get resized or moved when I resize the whole thing. Is there a flag I can set or some example code showing what I would need to override please?

[I have a tab ctrl as part of a dialog window and I have child controls within the layouts which form the tabs. Am wanting a GridCtrl to resize but I've checked and all child controls fail to be affected by the resizing of the tab.]

It seems (to me) like the default behaviour for a TabCtrl should be for its children to get resized when it gets resized same as a normal layout.

What do you think?

Nick

You need to call SizePos on the layout/ctrl in the tab, then it should behave as a normal layout.

```
    WithSomeLayout<ParentCtrl> t1;

CtrlLayout(t1);
t1.SizePos();
tab.Add("Tab1").Slave(&t1);
```
