Subject: project file as command line parameter

I would like to be able to open a project from File Explorer by double clicking the .upp file. I associated theide.exe with this extension, but theide.exe don't seem to care about the project file passed as command line arg. It still opens up the package selector dialog. Would it be possible to immediately open the project if a .upp file is passed as command line arg?

Actully, it does now (last thing added to 602 release) and it is even able to compile via commandline.

However, the trouble is that you need more than single file to specify the project - at least, you need to specify assembly as well...

So it has to be

theide examples Clock

This already works...

So it has to be
theide examples Clock
But this is not something that double click in an external program will ever invoke. How about

theide C:/upp/examples/Clock/clock.upp

And then theide would guess from the path that the assembly is "example".

Well, uhm, I do not exatly like the "guess from the path" part - packages can be nested, the name of assembly does not need to be equal to the first nest.

Anyway, maybe we could try something like that...

Anything before the last directory name is the assembly path: It is not that much "guessing". It seems to me that assembly nesting is not a problem here.

I have d:\uppsrc\plugin\gif package, but no "plugin" assembly...

However, never mind, I will try to do what you suggest.... (tommorow) (if it does not appear on [changelog] soon, please remind me
