Hi,

I need a widget for entering things like how long a certain task is expected to take in hours and minutes. Can EditTime be fudged to do that?
Someone here done that

Guido

EditTime won't do it because it only accepts times <= 12 hours. You need to define your own convert function and edit control:

```
typedef EditMinMax<Time, ConvertDuration>      EditDur;
```

You should still be able to use the Time class, providing durations are < 256 hours.

Actually, it turns out this is a bit of a cock-up (IMO).

Basically what happens is that the EditTime control is really an EditTimeANDDate control, and always expects a valid date to be entered first.

For example, with date format mdy:

```
23:00      - not valid  
11:01:2007 - valid  
11:40:00   - not valid  
11:00:2007 - not valid  
11:34:1900 - valid  
11:34:1900 23:30:01 - valid
```

So currently Upp has a 2 Date only controls and a Date AND Time control, but no Time only control.

I would just (as noted in a another thread) created Convert working with number of seconds....
(maybe even as double number to cover sub-second times).

Well, I think Duration is a general case and should be included in Upp.

I just ran into this problem, i.e., where Time is really Time&Date. I need a Duration type.

Imagine a case whereby process control batch has many different timed durations and we use Upp to present this to the operator.

Duration should be a type included in Upp. Also, it is not just a new typedef as was mentioned.

Value type must comprehend the new type Dur or Duration (depending on how it is named). There are guards that check for null and empty, and it switches on the test depending on the Type and applies the right operation for that Type.

Not as simple as just a new typedef as stated earlier:
`typedef EditMinMax<Time, ConvertDuration> EditDur;`

More is involved.

You shouldn't need to modify UppSrc, all you need is:

- A Duration class with operators to/from int, operators >, < etc. (just convert to int and compare)
- A custom Convert class/Edit ctrl

Since most of this is copying from existing code it really isn't much work, see attached. ToInt/FromInt could probably be improved, and you may wish to add Null support.

jlfranks

Not as simple as just a new typedef as stated earlier:

```
typedef EditMinMax<Time, ConvertDuration> EditDur;
```

More is involved.

I did say that you had to define a new Convert class, which is where all the work is done. It's possible, but perhaps not the best solution.
