Dear Forum,

First of all, thanks for u++!

I run FreeBSD and have v2007.1 installed from ports. I have somehow managed to make the templates vanish. I have tried make deinstall clean; make install but they are still missing.

Can anyone help me find them?

/Humperdinck

Ok, I can answer this myself. I found another thread that has three templates for download at:

http://www.ultimatepp.org/forum/index.php?t=msg&goto=10534&&srch=templates#msg_10534

Thank you to original poster.

/Humperdinck

I've met the same problem recently.
Many problems with TheIDE are solved while correcting files within
(local sources copy)/.upp
or
(local sources copy)/.theide
directories (depending on U++ version, I suppose).

I will try to find a better port install solution for upcoming release.

Recently I've installed 3 different versions of *BSD systems (PC-BSD, DesktopBSD and FreeBSD). In each of them I've made one rule which works fine all the time. It is nearly 100% probability it will work without problems for you too.

- * First, install upp2007 package from FreeBSD ports ftp with "pkg_add -r upp".
 - * Run "gcc --v" to test its version. FreeBSD 7 distribution has gcc 4.2.1 installed by default. This gcc version is buggy and creates U++ programs that throw critical exceptions. So if your version is 4.2.1 I recommend using gcc 4.3 by installing "pkg_add -r gcc43". This creates new gcc43 package, so you need to set up new compiler in TheIDE entering Setup-Build methods...-Compiler name = g++43
 - * Then I run TheIDE and it copies all the sources to my home directory /home/paul/upp. (just for test and to trick TheIDE compiling with my local sources). Then I run TheIDE and look if it works fine.
 - * Then rename /home/paul/upp/ to ensure no collisions in the next step.
 - * Then I use svn to get latest sources to where my local copy was with "svn checkout http://upp.svn.sourceforge.net/svnroot/upp/trunk/ /home/paul/upp/".
 - * Then I start TheIDE once again. On load I choose uppsrc/ide package. I switch to GCC Optimal, in Setup-Build methods I ensure that Release mode is switched to Shared libs. Then I go to Build-Output mode and switch both Debug and Release to Use shared libs mode.
 - * Then I start building TheIDE from latest sources. It takes rather long time but you'll have latest version of TheIDE built and sources checked - it is worth waiting. After compiling, look attentively at linking process: it should go without any errors. If errors appear, you most likely didn't switch to Shared libs or have wrong versions of libraries.
 - * After successful linkage I quit TheIDE. Then I copy /home/paul/upp/out/GCC.Gui.Shared/ide to /usr/local/bin/theide as root user.
 - * Copy old *.var and GCC.bm from old ~/.theide to ~/.upp/theide/
 - * Restarting TheIDE and ensuring it works fine. I assume successful TheIDE working is equal to overall sources testing since such a complex application works successfully for your configuration.
-
