I want to try a new version of mingw but do not know what files i have to download and install from sourceforge.

What do i need to get a GCC Version 4 MinGW? Are there any plans to bundle a newer version of mingw with UPP?

We use official mingw releases. Now it is 3.4.5 (and this version will be included in the next dev, now we have 3.4.2). 4.1.2 is still in beta phase, but once it'll be released it will replace current version. There are unofficial releases of 4.2 even 4.3 but I had troubles with them.

Actually, recently I have tried latest sjlj version and it seem like quite a good step forward.

At least, they support __thread variables now, although the implementation is somewhat slow.

I can use it in next dev version + latest win api package, of course if it will pass all tests.

To simplify the task, I have uploaded the "reduced" mingw42.7z to ftp public...

Should be direct replacemnt for current "mingw" directory; maybe some libraries are missing, please check...

I used this new Version for a complete rebuild of my project on vista an got this warning:

C:\upp\uppsrc\Core\TimeDate.cpp:35: warning: deprecated conversion from string constant to 'char*'

and this fatal error:
File 'libmysql.a' not found.
