With the new mingw, I have decided to measure the build speed of all available win32 compilers.

Benchmark was to measure debug mode compilation of UWord. For mingw, U++ linker was used. HYDRA was set to 2, BLITZ active.

Mingw 3.4 33s Mingw 4.2 23s (!) MSC 2003 17s MSC 2005 18s

GCC 4.2 is really quite an improvement! (but MSC 2003 is still the best...)
