I've not downloaded last dev version, but I would like to ask if there is any beginner sample for QuickTabs?? also, could it be integrated into CtrlLib? This last I'm asking because of chameleon, as you know I'm now making a ribbon skin and I can't chameleonize what's not included..

Regards

Well, there is no problem at all to move quicktabs to ctrllib but maybe better make it a "free" package. For now try to chamelonize it as it is now.

1. I have no clue how it works, that's why I'm asking for a beginners sample / tuto.

2. I stated I can't chameleonize what's not SURELY included in EVERY gui app, if I #include <ide/QuickTabs/QuickTabs.h> and do some stuff with its style in any chameleon skin file then I'm FORCING to include it, that's why I'm asking to move it to CtrlLib. OTOH I launched theide & opened ide main package, then wrote QuickTabs:: and saw there is no QuickTabs::style nor QuickTabs::DefaultStyle(), so it seems it currently renders all things in a static harcoded way..

Yes, quick tabs use their own rendering "system", In fact there is only one method you need to change QuickTabs::DrawTab. Now it uses bitmaps from QuickTabs.iml, but you can refeactor it to support upp themes.

Ok, I can with some time & patience, but chameleonizing it will need to create a ChQuickTabsStyle and have to reference it inside customized skins srcs (like ribbon one) and it will force to include the package in final app..

Regards
