Hopefully this is an easy question even though I've been pulling my hair out.

I am executing a select statement (SQL & Select data FROM table) that may not find a match for the criteria. How do I test for no match. If I try to test the SQL[0] parameter, the program bombs. Is there a way to evaluate for no return value.

Thank you for any assistance,

Dave

If your first Fetch() returns with false, you have an empty result set.
