OK, everybody who uses the "secret" IP - it has changed.

In order to get the new one, add these numbers to recent IP:

+8.-32.+204.-50

Mirek

(I am really sorry about secrecy here, but this is really low bandwidth line...)

Could you please make source releases of development versions of UPP for those, who is using Unix?

Thanks.

I checked the sum 4 times, so I think I've inserted the right number, but I can't connect to Uvs server. Before of changing it worked.

I too didn't get through. even telnet doesn't work to that "new" address, even less to port 21. I tried several times, and while previously only occasionally the sevice was unavailable, now it doesn't work at all with the new IP-number. without uvs my versions tend to be so old that I am really of no help...

thanks luzr, but it seems to be a different problem here: the IP is correct, but maybe the firewall does block port21? maybe you could choose a different port? ssh?

Well, this is really strange - people reportedly ARE able to sync uvs2 since the change took effect.

I where thinking of your provider's firewall which is supposed to prevent ftp-access for people surfing from outside of their network. that's why I asked here. usually providers only allow ssh-access from outside since ftp somehow transfers unprotected vebratim-passwords across the whole world...

Well, this is really strange - people reportedly ARE able to sync uvs2 since the change took effect.

I can confirm this, even I had to get complete repository with FTP for the initial checkou (otherwise it was too slow). Maybe that was a Linux problem, I don't know.  
BTW, if somebody experiences the same problem, here is the procedure :

- 1) Get complete uvs2 repository via ftp, and put in a local folder.
- 2) setup a local ftp anonymous server
- 3) backup original uppsrc.uvs, and change it to point to local repository (via ftp over localhost)
- 4) checkout all from the local repository
- 5) restore the original uppsrc.uvs and keep repo updated as usual via remote repository

All that greatly speeds up the initial checkout; plus, if you have problems on your local sources,

you can quickly recheck it from local repo.

Ciao

BTW, Tom has identified and fixed a couple of possible problems with FTP in Uvs2 that could eventually cause that "39MB stop" problem. Updated .exe and .zip are on FTP, also in uppbox repository (the home of uvs2).

(As there are even more problems fixed, I strongly recommend using this newer uvs2 version - until replaced by uvs3 of courses).
