I successfully installed 2007.1 on Linux but unfortunately, I am using 709-dev1 just now so my app wont build on 2007.1

Is there are way to get 709-dev1 or 710-dev1 installed and working on Linux please or do I need to wait for the next release?

I tried copying across the upsrc directory from the dev release for windows and it almost compiled but not quite.

Nick
