[View Forum Message](#) <> [Reply to Message](#)

DateTimeCtrl is gone. It's now replaced by DropDate and DropTime. DropDate is the old DateTimeCtrl, DropTime is a calendar + clock. Clock is fully mouse controlled. Additionally time can be adjusted by top buttons and by left and right slider.

There is no drop control to drop clock only but it can be easily done if someone needs it. It will be provided to you later if time will be separated from date. Top buttons of calendar were rearranged. I think it's more readable now for what they are.

Here is how it looks like:

Enjoy and report bugs!

I agree about the layout of the buttons - Very nice work!

Will this be included in next dev release? It will require some (minimal) changes to my code so it would be handy to know.

Yes, it will be included in the next dev (it's already in internal src tree)

Great control for date/time!

Actually I'd like to suggest slightly different position of top labels in the top of time widget. The cause of such correction is purely an ergonomical and design matter.

I think it's obvious that people used to see time in AA:BB format. So if you want design to be obvious, you should make top label a <<AA>>:<<BB>> format (<<,>> are arrows).

Also, I think left alignment of top label will make resulting time more clearly recognizable.

Next suggestion is to swap month and date labels (with optional adding date label - for those who is more used to line changers), for it will be more logical (and more clearly recognizable) sequence - year>month>date>time.

The last suggestion is to make seconds arrow of analog clock - optional, if it's not already.

sounds reasonable. I'll check it

[View Forum Message](#) <> [Reply to Message](#)

Added:

OneButton(bool b) - make "one-line" month-year button

Colon(bool b) - if true colon is displayed in clock header

SwapMonthYear(bool b) - if true month and year buttons are swaped (in one button mode displayed text is also swaped)

Seconds(bool b) - if false second arrow is not displayed

Changed:

Clock buttons are now centered.

Hi,

Great stuff! Is it possible to have the date on the lower edge of the calendar -- and the main control as well -- to be displayed as yyyy-mm-dd, instead of the American mm/dd/yyyy? (The American way is very confusing in my country, since we normally use dd.mm.yyyy.)

Having a way to set the separator character and field-ordering for this control would give most convenience for users.

--

I would really like to get access to this new date/time control ASAP since I'm currently working on an application needing this sort of thing. Where can I download it? I can't seem to find any later version of Upp than 710-dev1.

Hi. The format of displayed date/time depends on system locale. It's not hard-coded. New dev is coming this week, maybe even today

Subject: Re: DateTimeCtrl refactored...

[View Forum Message](#) <> [Reply to Message](#)

Thanks for the great news! And I mean both the new dev version availability and the automatic system locale detection. (The old DateTimeCtrl showed US style dates even on Finnish locale, so this is a major improvement.)

Are there also plans to release a .deb package for Ubuntu or a more generic src package? I'm attempting to develop my software on both Windows and Linux (and FreeBSD) in sync to resolve any platform differences along the way.

Thanks and regards,

Tom

Hi Uno,

I sure would like to get access to the current development version of Upp. Would it be possible to have the SVN on sourceforge updated to the current state of development, if 711-dev1 is not ready to be published yet?

Hi Uno,

Thanks for releasing the latest dev! It really is great.

I have noticed two issues on DropTime control -- eventhough it's really beautiful and easy for users.

1. DropTime uses 100% CPU when open. (At least on WinVista.)
2. It shows MM/DD/YYYY (US) format date even on Finnish locale, whereas it should be DD.MM.YYYY.

And, finally a wish you obviously do not need to fulfill: How about formatting the "Title bar" of the dropped control as follows: <YYYY> <MM> <DD> <hh> <mm> <ss>

(The < and > represent the adjustment arrow buttons.)

// Tom

That's really strange. Do you use SetLanguage in your app? If not the default locale is used.

dropped control as follows: <YYYY> <MM> <DD> <hh> <mm> <ss>
(The < and > represent the adjustment arrow buttons.)

Well, it can be done. Not a big problem. However now you can use SwapYearMonth so you'll get:
<YYYY> <MM> <hh> <mm>
instead of

<MM> <YYYY> <hh> <mm>

PS: Do you mean MM as number or name?

I know there is no DD but day should be picked from "calendar body" (I followed populars calendars).

Anyway, I'll try to add all your proposals (it's only few lines of code). Let the drop date/time be flexible

I have Vista too and did not noticed it. I must check it. R U sure it's from upp app (just want to be sure)?

Ok. I missed that. On X2 there is no full 100% (10%). I'll post fix today and update SVN. PS: Sorry for troubles..

I do not use SetLanguage. Should I? In my Windows installation the active system locale is Finnish. Or should I separately define locale for Upp somehow?

As for <MM> format, I do not have a strong opinion about this, but for me a number would be enough. It may be easier for people who do not speak english natively, but still need to access this widget on a system with English interface language.

Actually, I used already the SwapYearMonth..

Thanks,

Tom

Ok Here's the patch. It removes 100% CPU bug and also fixes refreshing background of header buttons if clock or calendar are used as separate controls.

Plese everyone that use dev releases apply it (to uppsrc/CtrlLib)

Yes, you should. I do sth like this:

```
SetLanguage(LNGC_('P','L','P','L', CHARSET_UTF8));
```

Of course Finnish locales must be present in Upp core lib (this is the place where format of date for given country is set)

Finish is not supported yet. Awaits somebody to do translations..
([http://www.ultimatepp.org/srcdoc\\$Core\\$i18n\\$en-us.html](http://www.ultimatepp.org/srcdoc$Core$i18n$en-us.html), also search the forum for details).

You can also set the date formatting regardless of current language settings using

```
void SetDateFormat(const char *fmt);
```

Yep!

I sort of figured it out that some translations are needed. I ended up updating Lang.cpp and core.t with Finnish translations and language info.

Please, evaluate them and include to uppsrc if appropriate. Please let me know if updates/fixes or more things need to be done on this subject.

--

BTW: SetLanguage(::GetSystemLNG()) helps quite a bit, as I later also discovered in the documentation you linked to.

Sigh... OK, my mistake, should have told that more clearly (again), but I really need that .tr file instead of patches to individual files.
