Hi,

I have an sqlctrl showing to columns of a database table (ID, NAME). It is showing 5000 rows of data.

How to I get the data from the second row, second column?

I trying this withoud success:

```
Value k(DBGrid.Get(1,1));  
String s=k.ToString();  
PromptOK(s);
```

or

```
Value k(DBGrid.Get(0,1));  
String s=k.ToString();  
PromptOK(s);
```

or

```
Value k(DBGrid.Get(1,0));  
String s=k.ToString();  
PromptOK(s);
```

Is this the right way? It seems to show always the value of the first column. How to get data from a Value Type?

Env: WinXP, upp 2007.1

Thanks

Alex

Alex, hard to say - too little info provided. Also, I believe you mean "SqlArray", not "SqlCtrl".

Please, the best way how to get a good reply to the question, or U++ bug or issue fixed, is to provide a "testcase" - a .zip compressed package as attachment that others can compile and test.

In more simple cases, quoting the code would do as well.

In this particular case, I would need at least to see how you have constructed your SqlArray(?) and how did you fetched the data.

Mirek

P.S.: ArrayCtrl::Get(1, 1) reads from second row, but second "index". It does not necessarily have to correspond to second column. Some indexes do not have assigned columns, some indexes can be in more than single column etc...
