i use the template for EditString and EditInt.
when i input values, i can AddHistory().
but i don't see any other kinds of actions i can take to its data, except clear(). i need Find, at least Erase, At, etc.

Well, that is correct.

If you need erase, for now I recommend Clear and recreate the list.

I had a similiar, but slightly different problem.

I only wanted to iterate over the existing entries, so I could present them in another dialog for changes... basically, I wanted a way to manipulate the 'history'.

To that end, follow this:

http://www.ultimatepp.org/forum/index.php?t=msg&th=3028& amp;start=0&

The changes I proposed will not change the entries, but will make it possible to iterate over them in a read-only fashion (thanks to the wonders of the const keyword).

As luzr said, you'd still need to use Clear and recreate the list, if you wanted to make edits... but at least you can see what's actually in the list.

I suspect this behavior is needed, in order to keep certain parts of the state stable (e.g. whether-or-not to display a drop-list at all).
