

Hi all.

I have to do a little project that require MySQL in a C++ program, so I searched the best IDE to do that and, after a long searh, I found upp perfect for this job. It has his own MySQL integration and examples, so I was really happy.

Unfortunately I am used to debug with the very user-fiendly interface of Visual Studio 2005 and the amazing Eclipse debug interface, so I was a bit in pain when I saw the mingw debug, with the assembly code. So I used the MSC8 compiler, but when i try to build the SQL_MySql example, i get a lot of errors like these:

```
----- SQL_MySql ( MT MAIN MSC8 DEBUG DEBUG_FULL BLITZ WIN32 MSC ) (5 / 5)
main.cpp
SQL_MySql: 1 file(s) built in (0:02.84), 2844 msecs / file, duration = 2859 msecs

mysqlclient.lib(charset.obj) : error LNK2001: unresolved external symbol __db_doprnt_
```

and so on. I attached the MySQL Server folders into the compiler setup, but seems that he doesn't like the library very much.

Can anyone help me, please?

Thanks
