Hi!

I was trying to determine how to obtain the skin from the OS (under Windows), so I thought that I'd install WindowBlinds, try out some skins and determine the limits of U++'s Chameleon.

Everything went pretty good and most stuff got skinned somewhere between good and great (except for menus, which were universally very bad), but I have run into serious issues with the skin Classic, from Stardock Design (included in the evaluation package of WindowBlinds).

Using this skin, all U++ applications lock up after a time, except the IDE. You can load up any app, and after playing a lot with the interface and especially dragging other windows on top of the U++ application freezes it. I noticed that if you put your cursor over the window border buttons, they are not animated, like in other apps, and almost inevitably freeze the application again. Also, windows have text which is not visible when window is focused. And the strangest part is, TheIDE is immune to these issues. Window caption is present and buttons are animated. Does U++ touch window drawing. Does TheIDE have some extra code for its windows?

The Classic skin was the only one I found that triggered this bug. It could be that there is something wrong with it. Still, other applications have no problems with it, and it would be great if U++ apps would not lock up if there is something wrong with the theme (considering the myriad of user themes on the Internet). I was using Windows Vista.

PS: I'm trying to find out how U++ obtains the skinning information. Could you direct me in the right direction? I'm trying to get the look of some controls which U++ does not cover.

Everything went pretty good and most stuff got skinned somewhere between good and great (except for menus, which were universally very bad)

Screenshot? Have you tried latest sources? A lot of effort went into this over recent weeks.

, but I have run into serious issues with the skin Classic, from Stardock Design (included in the evaluation package of WindowBlinds).

Any way how to try this?

No.

Maybe it is debug vs release or compiler dependent? ("retail" IDE is build with MSC).

Definitely.

For Win32, it is concentrated in CtrlLib/ChWin32.cpp.

Quote: Screenshot? Have you tried latest sources? A lot of effort went into this over recent weeks. I can post a screenshot, but it seems there are huge differences between Vista and XP. I have only XP home, so you'll have to wait till Monday for Vista screenshot. Under Vista, the cursor of menus is drawn correctly, but the rest of the menu looks strange. Under XP the menu looks normal, only the cursor is not skinned, but changes color.

This is in 712-dev1:

Quote: Any way how to try this?

Sure! Google WindowBlinds, download evaluation version.

Quote: Using this skin, all U++ applications lock up after a time, except the IDE. Does U++ touch window drawing. Does TheIDE have some extra code for its windows?

Again, on my home XP, this issue does not appear.

In the end, you must decide how far do you go with skinning. A lot of cross platform or not win32 native apps have poor support in this area.

I'll post some other screenshots, but I can only put one per post (could you increase this to 3 or something?)

Toolbars determine the skin, but only apply it to their bottom row.

Also, under Vista, the font select dropdown and the paragraph style select dropdown look quite strange and out of place (visually) on most skins, but under XP, seem to do a lot better.

Quote: Another thing related to bar is that after the new Chameleon style that was introduced lately, if you use ToolButton outside of a ToolBar, it has a different look. Its border is a lot thicker. A little diversity doesn't hurt, but during my summer holiday, I installed U++ on a computer, where

these borders where extremely thick. No other application had such thick buttons, so I don't think it was related directly to some custom windows skin. I'm sorry, but I forgot about the issue back then, and I didn't take a screenshot.

I said this in another post. Since then I was able to reproduce it, with the exact same bad look. It seems that ToolButtons outside of a toolbar are almost completely immune to system skin changes, the only thing that changes visually is the presence or absence of the ugly look. Here's a screenshot:

Quote:Again, on my home XP, this issue does not appear.

Good news (can be bad news actually, depending on how you see it). I managed to reproduce in a non-reliable way the issue under XP too. Same skin, same problem, TheIDE still not affected. But I did manage to lock up TheIDE just once, when it was running and I changed the system skin while TheIDE was running an application.

Well, I have tested WindowBlinds classic in Win Vista 64 and have not encountered U++ crash, only Windows explorer crashed... (which is not very encouraging w.r.t. finding a bug in U++

Have you tried to debug to catch the bug? If U++ app crashes in debug mode, should be easy to identify...

Mirek  
Explorer pretty much crashes quite often for me too.

U++ apps don't crash, they just most often but not always have no title text, and in 99% of cases lock up, as in they don't react to any events only after my mouse has entered the non-client area. I suppose I could try to debug it, and I had to go pretty low level, to see if there is not something preventing WM\_NCXXXX events from being processed correctly.

And it happens both in DEBUG and Optimal mode, with MSC7 (or 7.1) and MINGW.

PS: How about the chameleon bugs? Could you reproduce those?

I must say that poking into Chameleon code is one of my least pleasant activities in U++. But it seems that slowly I'm getting the hang of it.

Quote:It seems that ToolButtons outside of a toolbar are almost completely immune to system skin changes, the only thing that changes visually is the presence or absence of the ugly look.

I use a lot of ToolButtons because U++ lacks a good flat button. It seems that somehow the button does not manage to access the correct style, probably because setting up the styles is left to ToolBar. This fixes the issue:

```
ToolButton::ToolButton()
{
    Reset();
    checked = false;
    paint_checked = false;
    SetStyle(ToolBar::StyleDefault().buttonstyle);
    Transparent();
}
```

cbporter wrote on Thu, 31 January 2008 09:51I must say that poking into Chameleon code is one of my least pleasant activities in U++. But it seems that slowly I'm getting the hang of it.

Well, it is not a nice piece of code. For once, I have prefered compact code.... plus there is a lot of patching to accomodate everything over time.

Quote:

```
ToolButton::ToolButton()
{
    Reset();
    checked = false;
    paint_checked = false;
    SetStyle(ToolBar::StyleDefault().buttonstyle);
    Transparent();
}
```

Thanks, I guess you are right. Fix applied.

Well, for now I have solved the WindowBlinds issue by falling back to XP code if the name of the theme is not "Aero" (before, running on Vista was activated Vista parts of chameleon, now both Vista and "Aero" are required).

Sorry, even though I finally checked out the SVN version to see, my trial of WindowBlinds has expired , so I can not test it.
