I was wondering if there was a non-CtrlLib way of detecting if a URL/location string is a folder and, if it is, to pull all the files within the folder.

What library(ies) would I include if so?

Not yet.

There is support for regular filesystem (FindFile).

Then there is support for FTP (plugin/ftp).

But not much more now.

Mirek

Thanks a lot Mirek. I and my cohort figured it out via one of the GUI examples (using FindFile, like you suggested).
