Anyone tried PostgreSQL/U++? I'm getting leaks detected at the end of program execution, and I've discovered it goes away when isolating the psql Session open function in my program.

Note that I'm maintaining a global PostgreSQL session variable in a singleton class (this member variable is not static). Getting the class instance and getting a pointer to that PostgreSQLSession variable works well in my program...

Ideas?

Tomorrow I'll post the code, it's on the machine at my job running 2003 Server SP1+PostgreSQL 8.3+UPP 2008.1.

MAIN.CPP

```
include "sr2k8.h"  
#include "MainWindow.h"  
  
#define SCHEMADIALECT <PostgreSQL/PostgreSQLSchema.h>  
#include <Sql/sch_source.h>
```

```
bool ConnectToPSQL();  
void LoadConfig();
```

GUI_APP_MAIN

```

{
::SetLanguage( ::GetSystemLNG() );

LoadConfig();
if (ConnectToPSQL())
{
    MainWindow mw;
    mw.Run();
}
}

void LoadConfig()
{
    String cfgfile = ConfigFile();
    if (FileExists(cfgfile))
    {
        VectorMap<String, String> cfg = LoadIniFile(cfgfile);
    }
    else
    {
        // configuracion por default
        String s;
        s << "APPV=1.0\n"
        << "HOST=10.62.200.1\n"
        << "DATABASE=S2K8\n"
        << "USER=sis\n"
        << "PASS=sis\n";

        if (!SaveFile(ConfigFile(),s))
        {
            exit(-1);
        }
    }
}

bool ConnectToPSQL()
{
    if (!G_STATE->GetPsqlSession()->Open("host=localhost user=sis password=sis
dbname=S2K8"))
    {
        Exclamation(Format("Error abriendo base de datos: %s",
        DeQtf(G_STATE->GetPsqlSession()->GetLastError())));
        return false;
    }

    return true;
}

```

```
}
```

Sr2k8.H

```
#ifndef _sr2k8_sr2k8_h
#define _sr2k8_sr2k8_h

#include <CtrlLib/CtrlLib.h>
#include <SqlCtrl/SqlCtrl.h>

using namespace Upp;

// definiciones para PostgreSQL
#include <PostgreSQL/PostgreSQL.h>
#define SCHEMADIALECT <PostgreSQL/PostgreSQLSchema.h>
#define MODEL <sr2k8/sr2k8db.sch>
#include <Sql/sch_header.h>

#include "globalState.h"
#define G_STATE GlobalState::getInst()

// layout de las ventanas
#define LAYOUTFILE <sr2k8/sr2k8.lay>
#include <CtrlCore/lay.h>

#endif
```

globalState.h (singleton class spec)

```
#ifndef _sr2k8_globalState_h_
#define _sr2k8_globalState_h_

#include <PostgreSQL/PostgreSQL.h>

using namespace Upp;

// clase singleton que mantiene un estado global del sistema

class GlobalState
{
    static GlobalState* pInstance;

    PostgreSQLSession pgsq;
    String currentUser;
};
```

```

public:
static GlobalState* getInst()
{
    if (!pInstance)
        pInstance = new GlobalState;

    return pInstance;
}

PostgreSQLSession* GetPsqlSession() { return &ppgsql; }

protected:
GlobalState() {
    currentUser == "";
};
GlobalState(const GlobalState&);
GlobalState& operator= (const GlobalState&);
};

#endif

```

This is initialized in globalstate.cpp as follows:

```

#include "globalState.h"

GlobalState* GlobalState::pInstance = NULL;

```

Do you see any problem related to the singleton??? Maybe it's that 'new Globalstate' on singleton getInst() method.

Yesss,,,, fixed it!

The last line of main is now:

```
delete G_STATE;
```

G_STATE is a macro so, it's equal to:

```
delete globalState::getInst();
```

since getInst returns a pointer, it's all ok.

Well, well, that is the price of NOT using U++ way od programming:)

We have nice Single template.

Remove these statics and just use Single<GlobalState>() instead of GlobalState::getInst. Also, your version is MT broken (depends on compiler); Single is guaranteed to work.

No well-behaved program should contain similar "delete"

Mirek

Hey Mirek, great!

Should I define Globalstate as a normal class (I mean, not using statics like in the Singleton pattern)?

Discovering U++ is fun!

Depends. I would either use Single directly or created a global function to return Single:

```
GlobalState& TheGlobalState() {  
    return Single<GlobalState>();  
}
```

but you can also stay a bit closer to "exact" singleton pattern:

```
class GlobalState {  
    static GlobalState& getInst() { return Single<GlobalState>(); }  
};
```

or if you insist on pointer (which IMO is stupid here, as the result can never be NULL):

```
class GlobalState {  
    static GlobalState *getInst() { return &Single<GlobalState>(); }  
};
```

In either case, GlobalState will be destructed at exit, avoiding memory leak.

Mirek
