What I need is a user/pwd validation, my table is defined with the schema:

```
TABLE_(users)
  SERIAL_ (id) PRIMARY_KEY
  STRING_ (user, 30) NOT_NULL
  STRING_ (realname, 30) NOT_NULL
  STRING_ (passwd, 30) NOT_NULL
END_TABLE
```

The validation is:

```
void LoginWindow::BtnOkPush()
{
  Sql sql(*(G_STATE->GetPsqlSession()));
  sql*Select(SqlAll()).From(users)
  .Where(user == (String)editLoginName.GetData()
  && passwd == (String)editPassword.GetData() );

  if (!sql.Fetch())
    Exclamation ("Incorrect pass and/or username.");
  else
  {
    G_STATE->SetCurrentUser(String(sql[realname]));
    PromptOK("Welcome [* " + String(sql[realname]) + "]);
  }
}
```

The validation works in the sense that entering an invalid user/pwd combination displays the proper message. But when you enter data for a row that exists, the Welcome message appears without the name (I mean, seems that sql[realname] is empty!).

Any ideas?

P: How I can trace SQL execution?

I've discovered that I can refer successfully with sql[0],sql[1]... but not with sql[username], for example.

How I can refer to field names instead of numbers?

IMO your .sch inclusion is wrong, that is the most likely reason. But we need testcase for further advice.

Also, it is better to have upper-case column names, to avoid clashes with e.g. local variables.
