Hello,

I found <http://nehe.gamedev.net> where there are nice tutorials covering OpenGL. I followed the first tutorials and I used as skeleton the package refence/OpenGL. All the code of the tutorial finish in GLPaint() method and everything works perfectly.

What I would like to have now is the automatic animation of the picture without to drive it with the mouse done via

```
virtual void MouseMove(Point p, dword) {  
    point = p;  
    Refresh();  
}
```

It should be very easy but I am facing problem.

For example I added the callback LeftDown and the method Rotate() that change some parameter of the figure but nothing change in the screen when I leftclick

```
virtual void LeftDown(Point p, dword) {  
    Rotate();  
}
```

```
void Rotate( )  
{ for(int i=1;i<=1000000;i++) {  
    rtri+=0.2f; //it is used in GLPaint  
    Refresh();  
}  
}
```

Instead MouseMove() works fine. What am I missing?

(tell me if a testcase is needed although refence/OpenGL with an automatic animation would be ok)

Hi Luigi,

I attached an example I have made with a timer.

By the way, have you tried to run your app in X11?

Matthias

Matthias

Hi Matthias,

thanks a lot for the example.
I've not yet tried it under linux. I'll give a try tomorrow.

I tried in Ubuntu but I was not able to compile your code. It does not find GL/gl.h etc... Under linux I've not the latest dev version and maybe I should install the openGL too.
I should update it but I use U++-linux rarely.

It would be nice if you can check it with Linux since I have problems with X11 GLCtrl implementation.

I get a window handle error when GLCtrl window is mapped to X11 window.

Thanks,
Matthias

I've Ubuntu. Do you know if the OpenGL library come with U++ or I should install it from a third part? At the moment there are many gl...h not found.

try to look in synaptic (or what package manager you use) for opengl libraries, especially for packages with "*dev" at end.

OK, I installed Mesa and compiled the reference test case and the Matthias' package. Both compile without problem but do not show anything. The error message in the opened window is: "GLCtrl: CreateGLXWindow: impossible to find a suitable visual"

I can run other test package if this can help. Please consider that my linux Upp-dev version is before of 2008, perhaps the december version. Please post o pm to me the most updated GL package if you want I try it on linux.

Have you compiled it in DEBUG mode?
Regards,
Matthias

Regards,
Matthias

No, only in release mode. If you think make sense to test even the debug mode I'll try it too.

Thanks Luigi, can you please compile in DEBUG mode, I would like to see if you also get the message I got.
But I am not sure whether the X11 error messages were already implemented in your version.

Matthias

I compiled in debug mode and got the same error.

Luigi, thank you for your help.
I fixed the problem I encountered with OpenGL example.
