Hi,

when you remove an item from a DropList it normally selects the first item in the DropList, but if that Item was the last one it won't update the screen, you have to click on the DropList and that it will update itself.

I have attached a test case.

BTW: If I use the Assist++ to view the available methods from the DropList class it doesn't show me the Remove(int i) method.

Could not reproduce. Everything worked as expected. Could you post U++ version number and build settings.

Yes, you are right. It doesn't appear under "all", but does appear under "DropList".

Hm, I'm on Windows XP with latest SVN.

Hi. I've tested it under Ubuntu, U++ SVN 182, and indeed DropList isn't updated after removing last item.

Reproduced.

Well, I am not 100% sure what the right behaviour should be here. DropList is explicitly designed to allow having the value not in list. OTOH, the "SetIndex(0)" after removal was already there...

Well, I guess under circumstances, this is the right fix:

```
void DropList::Adjust()
{
  int i = FindKey(value);
  if(i < 0)
  if(GetCount())
    SetIndex(0);
  else
    SetData(Null);
}</pre>
```

I guess it could be solved also by adding:

```
Sync();
in DropList.cpp(line 88) in Remove function

void DropList::Remove(int i)
{
   key.Remove(i);
   list.Remove(i);
   Adjust();
   Sync();
}
```

Sync-inc seems the right behavior since almost all functions from DropList do that.

PS:Mirek, could you explain if I'm wrong?

IMO, this is exactly the dilemma we are facing...

What you sugest would make it seem empty, but GetData would return the original value.

I think the behavior of Mireks patch is right, because when I remove an element from the list, I really want it to be gone .
