Subject: options to linker (not compiler)

hi boys (and girls?).. just fiddling a little with upp2008.1beta2/mingw (separate mingw) on a xp box.. debugging (with gdb (separate gdb).. debugging worked fine and then stopped working (ignoring breakpoints and stopping at one specific place no matter what i did).. so i looked around a little and found that there were some bad experiences with gdb (and blindly follow someone who gave the advice "clean uppout and then build all" problem is that clean uppout deleted all my sources..) so i fidgeted a little with the compiler flags to see if i could help gdb a little, seems the option 0 2 is always passed to the linker (-Wl,0,2) and i can't find anywhere to put additional linker flags in the environment.. where do you do that or modify the built in ones?

thanks
j

Recently I had to modify manually msc builder code to be able to set linker option (increasing of stack size). I think I could add linker option field to theide. Maybe this week.

Project/Package organizer, right click the right pane and choose "New Link options...".

Mirek
