Hi. I want to use a ListBox like widget. I don't know which control is it equivalent in Ultimate++.

Should I use ArrayCtrl, GridCtrl or other control (ColumnList, FileList)?

Maybe an experienced user could give a list with Upp widgets and their equivalents in other toolkits (U++ - gtk+ - windows).

See the list of all widgets.

ColumnList is probably what you want, though it doesn't do keys unfortunately.

You can customize ArrayCtrl to look like a ListBox.

Of course, it has much more features, but it is not a problem, I think.

Well, ListBox control is a simple widget. It doesn't need SQL integration, multiple columns, etc. I want to use it to control which columns are visible in GridCtrl widget.

|Stock(ListBox)|      |Current View(ListBox)|

---

Column2		Column1		
Column3		Column4		
ColumnX		<=	Column5	
ColumnX		=>		

---

In that case is better having a simple widget, because using ArrayCtrl or GridCtrl here and in other

places where a ListBox is needed, will increase executable size.

It is possible to have something like Firefox "Grid" control have for hide its columns?

GridCtrl has built-in controlling of columns visibility. You must write grid.Hiding() and now in popup menu columns submenu should be activated.

PS: Indeed firefox way to hide/show column is very nice. I was thinking about adding this to gridctrl.

Thanks for your answer, it simplify the development process .

The problem is when choosing column to be visible again, it doesn't resize to its last size.

What should I do? Is it the default behavior of GridCtrl?

Oops, I must have broken something lately (I think in absolute mode everything is ok). I'll check that today.
