I have TheIDE maximized. When I minimize it and then click on the taskbar to bring it back to the foreground, it is no longer maximized. But it evidently thinks it is as when I click the restore button it becomes yet smaller and the button now changes to a maximize button. So it becomes a "3-state" affair.

I'm on W2k with 2008.1Beta2 and running dual monitors. One monitor has fewer pixels than the other and the "wrong" maximized size looks about like the smaller monitor so it may be picking up its size clues from the wrong screen.

It seems to be an annoying bug if not a show-stopper.

Hm, with single monitor, this does seem to work OK.

I will alter the author of multimonitor support....
