Subject: Is there an easy way to leverage callback into multi-cast delegate?

The callback mechanism works great for a 1-to-1 connection.

However, we have a need for implementing multi-cast delegate for a publish-subscribe pattern.

Is there a way of leveraging the callback mechanism to do this?

Use "<<" operator, e.g.:

```
 m_button << THISBACK(OnButton1);
 m_button << THISBACK(OnButton2);
```
