As far as I am concerned, it is time to do the 2008.1 release.

So please, if you have a bit of time, proceed. Make it 2008.1 in about box, but name the file "rc1".

If everything goes well, we will just rename the file to have the "final".

Also, this time I believe the primary source should be "svn" type of release. So start with that, perhaps create "raw" source package (without makefile) and let others to build from that.

Mirek

what about make an upp-2008-rc-1 branch on svn ?

Max

EDIT... to do that, we must reorganize a bit svn repository.... it was made without trunk main folder, so we should move all stuff in order to create branches and tags.

That should be a good stuff, imho... it allows to "freeze" releases on svn.

I'm waiting for confirmation before doing it, as it requires people to do some changes on their local repositories.

Ciao

Max

Well, release 2008.1-rc1 is on restructured svn.
To get it, just do :

svn co <https://upp.svn.sourceforge.net/svnroot/upp/tags/2008.1-rc1> upp-2008.1-rc1

And you'll have a local copy of it.

Please DON'T commit changes on it, that's just a code-freeze for 2008.1-rc1. As sourceforge don't allow for read-only repository configuration, I can't force it !

Ciao

Max

BTW, I did install svn280 on clean WinXP yesterday and I did notice couple of minor things:

- the included SDL lib is 1.2.13, but at official download page of U++ there's only 1.2.12 package.
- after installation when the build methods are detected by that wizard, the SDL directory is not pre-filled. Why not? It's installed anyway in \$installdir/sdl
- mingw optimal does use BLITZ + all static - looks like it works as expected, so it's not bug report, just to let you inform what's the default settings after install on clean machine.

I will update SDL today or tomorrow and copy 2008.rc1 on sf.net

Do not forget about replacing mingw too (and uld etc..).

That unofficial one we are using in beta2 seems to have issues...

Mirek
