Subject: How to create package to be included another packages

Hi,

I'm trying to create includable package from SQL_Sqlite3 reference package. I have modified this example from console application to single class.

If I include simple.cpp in beginning of my to_be_born_application, it works fine. But if I'm trying just to add the modified SQL_Sqlite3 -package into project, added package gets compiled, but my application can't use it. If I add package and include cpp I get linker errors from double defines.

If someone could descripe steps I have to take to make this work I'd be gratefull.

Actually, I am quite confused...

Reference packages are just examples. If you want to use the code there, probably the best option is to start a new project and paste the code there.

Well, maybe attempt to single explanation of how this package stuff works:

If you are developing MyApp, this will be your "main package". If MyApp is about to use Sqlite, you have to:

- add plugin/Sqlite package to "uses" list of MyApp
- place into MyApp.h
  #include <plugin/Sqlite3/Sqlite3.h>

plus alternative use other headers of Sqlite3...

Well, if there are still troubles, I guess zipping your main package and posting here is not a bad idea...
