I've got gcc-4.2.3 on this computer. The deb package wants
gcc-4.1
libstdc++6.4.1.dev
gcc-3.4-base
gcc-4.1-base
g++4.1
libstdc++6-dev
gcc-3.4

Maybe I'm just not understanding it, but why does it have these version specific compilers? and why two very different versions?

Because 4.2.3 is buggy to the extend that U++ apps do not work in it.

Mirek

What about 4.3.1?

What about 4.3.1?

4.3.1. works well, but is not in standard ubunut repos.

4.3.1. works well, but is not in standard ubunut repos.

Mirek

Well, using Debian proper...very annoying.
Cannot blacklist 4.2.1 instead of demanding specific version?

I have always dependency problems on debian lenny. I must force the .deb installation and then i cant't do anything with other packages. apt wants uninstall upp before. I thinks problems come for libstdc++ version required.

Trying to do, but in debian control file there's no simple way to blacklist a particular version.
I'll try to add as "(< 4.2) | (> 4.2)", hoping that works.. You'll find it on today svn release.
