Hi,
There are many way to add a link in your app.
You can use RichTextCtrl:
rtc.SetQTF("Made with [^ultimatepp.org^ Ultimate\1++\1]");
you can also use a button:
btn.WhenAction = callback1(LaunchWebBrowser, "http://ultimatepp.org");
it's up to your imagination what you can do with. You may use a widget which support qtf and
format your hyper-link in qtf or use LaunchWebBrowser(url) directly.

Edit: btw, i don't know why qtf hyper-link doesn't work with Label, it appear formated like a
hyper-link but clicking on it doesn't open the browser.

Label has IgnoreMouse=true does it not?

Well, even with IgnoreMouse(false) it doesn't work. Seems Label doesn't receive any mouse
events because also WhenAction doesn't work.

2008.rc2, Ubuntu

Yes, that is by design.

Note that Callback1<String> is required to process hyperlink click.

One of reasons why Label is completely static is that in its LabelBox variant, it would eat events intended for widgets in the box.
