Porting the upp ide sources to compile on NetBSD was not so difficult, but I'm having issues proceeding.

The compile docs say to copy ide and upp to where I like, but I appear not to have a "upp" directory.

I create one, and using ktrace, I notice it wants to find a "upp/GCC32.bm" file, which also I do not have.

touching to create an empty file lets me start the IDE, I can pick examples and look around. Building does not work, which I suspect is due to having an empty GCC32.bm file.

Anyone feel like fleshing out the Compile instructions?

Lund

Ok, GCC32.bm does indeed have stuff in it that specifies how to build. I have no idea where it is supposed to come from, but for now I just took the one out of the Linux binaries, and modified slightly to fit with my includes.

.. Also, INCLUDE takes multiple paths seperated by semi-colon.

My upp directory is also expected to have "uppsrc" in it, so I have fixed that. Now I am building HelloWorld example.

Hello,

Welcome to the topic regarding the build on POSIX systems

Ah cool. Although my issues were based after the build was done/ported. Minimal changes were needed for NetBSD, and most of them to get around the non-POSIX calls you have in there. (ie, the Linux ftruncate64* hackery, ick).

For fun, I ported it to OsX as well, and its linked. Doesn't run very far though, oh well.

Alignment issues and endianness... Going to solve that after new Draw....

Yeah, that was my guess. I did some poking around in PixelArray and got the first dialog up ok. But would require a lot more to do anything useful.

Well, PixelArray will likely be gone in next Draw... That is why it is not a good time for fixing this now..
