hello all i wish this is the right place for my question

is there is a function that i give it a path and it creates it like

```
createpath("C:/downloads/math/");
```

and it makes these folders

as when i used

savefile function to save a file it didn't create the path when it didn't find it

Hi!

There is RealizePath and RealizeDirectory.

It checks if the given directory exists and if it doesn't exist it will be created. If you are sure that it doesn't exist you can directly create a directory with DirectoryCreate.

You can find many useful functions to handle files and directories in Path.h. Have a look there.

Zaurus

Sorry. Documentation is a little bit limited in U++ at the moment, but the functions in Path.h are

---

pretty easy to understand.
