I stumbled across ccache when compiling qsvn. It seems to accomplish something similar to blitz. Someone even compiled it for Windows.

From the site:
Quote:ccache is a compiler cache. It acts as a caching pre-processor to C/C++ compilers, using the -E compiler switch and a hash to detect when a compilation can be satisfied from cache. This often results in a 5 to 10 times speedup in common compilations.

Afaik it is rather similar to what our "out" directory structure does for us for free..

AFAIK it just stores compiler commandlines and files fingerprints and caches results of compilation.
