I am right now uploading "non-public" main repository mirror to the

<http://code.google.com/p/upp-mirror/source/checkout>

I plan to to create either svn commit hook or maybe cron job to do it regularly. So at worst, the mirror will be only one day behind...

(The problem is that svnsync to googlecode seems to be quite slow - it takes about 5 minutes to send one revision).

OK, everything went well, mirror is "on".

It should be updated each hour from the main svn repo.

If I want to get the latest and most frequently updated SVN, than this is the repository I should check out, right?

And what is the current flow of repository updates and when do they happen? Which is the main SVN repo? And is UVS still being used/updated?

UVS is terminated.

The main repo is on the same "nonpublic" (again, bandwidth issues) IP address, repository is called "upp".

This repo is each hour mirrored on googlecode. So the mirror is at worst one hour behind.

If you need write access to main repo, PM me - one advantage of svn is fine granularity of write rights...

And sourceforge is no longer updated? It should be updated also to keep the project "alive".

Unfortunately, it is not possible to have mirror on sf.net.

Also, svn link on sf.net now points to the mirror.
