I'm using the 2008.1 mingw download, hacking the HomeBudget code, which is a very nice example, thank you very much.

I added a hidden column to add a RichEdit control as the editor, and a RichTextView as the display, both of which I'm bringing up in a second window. All of this also works very well, thank you again.

```
RichEdit ertv;  
RichTextView rtv;
```

```
money.AddColumn(NOTES, "Notes").Edit(ertv).Hidden();
```

```
(with RichEdit ertv;)
```

However, I ran into a problem where the accepted row data would not update the sql database if only the hidden control data is modified. If one of the visible column entries was modified, then the entire row data was saved correctly, including the hidden row data.

I debugged this and found that GridCtrl::IsModifiedRow() was not returning true. After several hours of trying to figure a way to get it to recognize that the hidden data had been modified, I finally just added

```
void SetModifiedRow() { row_modified++; }  
to GridCtrl.h at line 1177, and then called it from a callback.
```

```
money.WhenEndEdit = THISBACK(EndEditNotes);
```

This seems to work now, but I'd like to know if there are any other accepted ways of dealing with this issue.

Thanks,
Jay Norwood

Thanks for reporting that. I'm afraid there's no easy fix but I'll try to do something with that.

I am tryng to modify the USQLExample in the same way I would like to add a richtTextCtrl to act as modifier of a WHO BORROW field in the borrowed table
Please jaynorwood cand you post your code example for a newbie ?
My goal is to make this field in the table bigger in capacity and to edit it with an RichTextCtrl outside of the gridCTRL to display and edit this field in the table BORROWED.
thanks in advance

I would like to know what events trigger the WhenEndEdit callback. I have a table in which I would like to do some sanity checks whenever a row is visited (whether or not any changes are made). WhenUpdateRow appears to be called only after a CHANGE has been made to a table row. WhenEndEdit is called when I simply left-click on a row. Is there a callback that I can map that will not be called until I press my ENTER key (following any or no actual edits within the row)?
Is there any place in the Documentation that describes the circumstances under which each callback is delivered?
