hello

how can i open a window in hidden mode

.Hide() dont do any thing

You don't have to. An unopened window can still be handled as if it were opened, so you don't need a hidden mode.

Why do you want to have it open in hidden mode? It does not make any sense to me. It is either open or not. What are you trying to achieve?

this window has a tray icon so i want the window to be hidden

but i can show it from the tray icno

thanks for your replay
