
Subject: Console Output In Linux

I'm not having luck printing to the command line while debugging in Linux. Everything works fine in Windows, and the compiled program prints to the command line in Linux when run directly.

I've tried:

- 1) Running theide from the command line.
- 2) Adding theide to the KDE menu and selecting 'Run in terminal'
- 3) And selecting console from Run options

Sorry if this also shows up on the mailing list, but despite being subscribed, my posts are not showing up after 12+ hours.

Thanks,
Andy Barilla
