Subject: Is there a way to fetch objects w/o default constructor?
Posted by Mindtraveller on Mon, 08 Sep 2008 09:25:45 GMT

Simplified code as a description of problem:

```
class Project
{
    Project(TabCtrl &tabs) {/*add new tab with Project controls*/}
};

class App
{
    void Serialize (Stream &stream) {stream % projects;} //ERROR: no default constructor available
    Array<Project> projects;
    TabCtrl        mainTabs;
};
```

Is there a way I can fetch my Project objects with auto-adding to the tabs?

class App
{
    void Serialize (Stream &stream) {stream % projects;} //ERROR: no default constructor available
    Array<Project> projects;
    TabCtrl        mainTabs;
};
```

Is there a way I can fetch my Project objects with auto-adding to the tabs?

Yes, but not really recomended

The trick would be to implement your own Array serialization, using "new" variant of Add.

Something like:

```
if(s.IsLoading())
    projects.Clear();
int count = projects.GetCount();
s % count;
for(int i = 0; i < count; i++)
    if(s.IsStoring())
        s % projects[i];
    else
        s % projects.Add(new Project(tabs));
```

(I would rather find some other solution. IMO, except special cases, classes should have default constructors).

So what "right", or "typical" solution of such a common problem is recommended? Just to make default constructor along with something like void Setup(.....) ?

```
stream % projects;

if(stream.IsLoading())
{
    for (int i=0; i<projects.GetCount(); ++i)
        projects.Setup(......);
}
```

This method has one big drawback: I can`t hold any references inside Project class because I can`t initialize them in constructor. In my previous example this means i.e. I can`t hold tabs reference inside Project which is very uncomfortable. Using simple pointer and setting it inside Setup() is no good too.

Well, that is what I would use.

Quote:

stream % projects;

if(stream.IsLoading())
{
   for (int i=0; i<projects.GetCount(); ++i)
      projects.Setup(......);
}

Well, I actually do not really know what degree of flexibility is needed... Is the number of projects fixed and only the content is changing? Too little info to discuss the solution.

That is correct. Personally I would do this sacrifice in order to avoid "Add(new)" variant. (Well, as you might have noticed, I tend to judge the quality of code by number of new/delete statements

Thanks. I think I`ll store these objects pointers in Ptr objects. This would at least look better than plain pointers.

That is only useful if they can get destructed while "parent" object is alive....

Plus auto-initialisation to NULL. One less thing to forget is always nice
