While importing icons into iml. I find myself having to use the system file manager to preview the icons before adding them. Would it be simple to enable image preview in the open dialogue? maybe a check option to enable preview or different view types, like list, details, and icon. It would at least mimic the system's file chooser a bit more.

Quite simple.

```
FileSel& FileSel::Preview(const Display& d);
```

I think captainc was trying to say that the preview should be enabled by default for the icon designer.
