Hello All,

I was presented with a busybox shell. Error messages on boot include:

"Begin: Mounting root file system... ...

Begin: Running /scripts/local-top ...

Done.

/init: /init: 1: cannot open /dev/root: No such device or address

Begin: Running /scripts/local-premount ...

Done." ...

"Target filesystem doesn't have /sbin/init"

I'm running Linux but not Ubuntu (Mandriva).

You didn't switch your hard drive cable or changed your bios boot configuration nor updated your motherboard bios I guess so:

- You had a kernel or bootloader update failure (before last rebooting)
- Or a disk failure
- Or you added bad boot parameters in your lilo or grub configuration file

Better to ask in a specialised Ubuntu forum. Most people run Windows here.

Suppose your filesystem is installed on the partition /dev/hda1, try to append

root=/dev/hda1

to your linux kernel command-line in your bootloader.

/dev/hda1 is an example !!!!
