Subject: Using .NET components

Dear all,
I am a newbie what U++ concerns, and learning C++ is some years ago. However, it seems that U++ is reason enough to reactivate some C++ skills.

So far I have no idea about the library structure in U++, how to integrate and use components etc.. I have some experiences with Delphi and are wondering whether available .NET (or other?) components can be used with U++.

Would it be possible to use a .NET component like SpreadSheetGear (http://www.spreadsheetgear.com/) or TeeChart (http://www.teemach.com) in U++, and would this be complicated? (I am aware that these components have some disadvantages like being bound to Windows, and costing considerable money, however the advantages prevail). Maybe someone has even experience with one of the mentioned components?

I am looking forward to receive some hints on these issues.
Thanks,
emomartin

Nobody ever tried. I am not sure it is even possible, but maybe, in theory, it is.
