Subject: More new functions
Posted by koldo on Wed, 22 Oct 2008 21:25:26 GMT

View Forum Message <> Reply to Message

Hello all

I propose you some new functions tested in GNU/Linux Ubuntu (Gnome), XP and Vista.
Please give me your feedback and feel free to fix everything:

String GetExtExecutable(const char *ext);

// GetExtExecutable("pdf") will return the name of the program
// that by default open pdf files.
// In XP/Vista it will return the program with the full path

bool LaunchFile(const String& file);

// LaunchFile("Sheet.xls") will open the file with the
// program asigned by default to open xls files

int LaunchCommand(const char *cmd, void (*readCallBack)(String &));

// LaunchCommand("mplayer myclip.avi", MyCallback) will launch
// the command line program with args without opening a window, and
// all the output will be sent to MyCallback(String &) function

int LaunchCommand(const char *cmd, String &ret);

// LaunchCommand("mplayer myclip.avi",str) will do the same
// but sending the output to String str

String GetDesktopFolder();
String GetProgramsFolder();
String GetAppDataFolder();
String GetMusicFolder();
String GetPicturesFolder();
String GetVideoFolder();
String GetPersonalFolder();
String GetTemplatesFolder();
String GetDownloadFolder();

// These functions return the folder assigned for Desktop,
// Program Files, etc.
// (from now please do not do this:

```
//     AppendFileName(GetHomeFolder(), "Desktop");
// to refer to the Desktop folder or using
//     "C:\\Program Files" ...
// in many languages is wrong
// It does not handle firefox download folder as it has been
// impossible for me to know where it is (until now)

bool FileCat(const char *file, const char *appendFile);

// FileCat("FirstFile", "SecondFile") just append SecondFile
//   from the end of FirstFile
```

As you may see some of them use in Linux Portland XdgUtils in the background.
I think it is a strong portable widespread source of information.

If somebody is interested I have a small class that works like
LaunchCommand but opening a command window that handles \r and
\n properly (to be used for example with mencoder).

Best regards
Koldo

View Forum Message <> Reply to Message

These are great; really good functionality. Are they being added to core? or maybe we can add
them as a utility package in bazar if not.

Subject: Re: More new functions

View Forum Message <> Reply to Message

Thank you. About how to integrate them in Upp is a matter to be decided by the main developers.

Just to say that I have ready to post in few days a new version that supports firefox (if firefox is the by default web browser, GetDownloadFolder() returns the folder where the downloads go by default).

Best regards
Koldo

Can you explain this line to me?
int LaunchCommand(const char *cmd, void (*readCallBack)(String &)) Particularly the readCallBack part.

Also, if you're not using a GUI (CtrlCore), what will happen with this line: Ctrl::ProcessEvents();

captainc wrote on Fri, 24 October 2008 13:05Can you explain this line to me?
int LaunchCommand(const char *cmd, void (*readCallBack)(String &)) Particularly the readCallBack part.
Shouldn't this be:
int LaunchCommand(const char *cmd, Callback1<String> readCallBack)

captainc wrote on Fri, 24 October 2008 13:05Also, if you're not using a GUI (CtrlCore), what will happen with this line: Ctrl::ProcessEvents();
I haven't tried, but presumably it won't compile. I'm also not sure if it's safe to call ProcessEvents from outside the GUI thread, but I'm guessing not.

Perhaps you could replace ProcessEvents with Sleep? If somebody wants to update a GUI then they should use the Callback version of LaunchCommand and do it themselves. I think it could then be run in a thread, which would be more useful for command line apps IMO.

Subject: Re: More new functions

Hello all

Thank you for the feedback. First I inclose you a screengrab of a program I am doing that uses these functions. It is very preliminary but it runs:

With this program I drag-drop movie clips in a main track that I convert in DVD format mpg files:
- With LaunchCommand(const char *cmd, String &ret); I get the video images you see in the center-left side column using mplayer
- With LaunchCommand(const char *cmd, void (*readCallBack)(String &)); I get the final .mpg DVD compatible file using mencoder. All the mencoder output goes to a function that sends it to a window (in the screengrab). If the window is closed, it kills the process before.

Coming to the comments:
- You are right: I have to change LaunchCommand in case of non GUI program to not call Ctrl::ProcessEvents();
- Ctrl::ProcessEvents(); lets the main GUI program to follow doing other things and being responsive to user without stoping the process. The command runs in another thread and the main GUI program only gets its output.
It is not perfect multithread, but it works well.
- In LaunchCommand, for example, to join to files, I would do LaunchCommand("mencoder a.avi b.avo -oac copy -ovc copy - ab.avi", myfun);
a basic myfun would be like:
void myfun(String &s)
{
    MySendStrToCommandWindow(s);
    MyParseStrToMoveProgressBar(s);
}
About the functions, I have prepared more but before finishing them I would like to ask you if putting them in different functions or declaring them into classes like:

class SysFolders   // Special folders
 String GetDesktop();
 String GetPrograms();
 String GetAppData();
 String GetMusic();
 String GetPictures();
 String GetVideo();
 String GetPersonal();
 String GetTemplates();
 String GetDownload();

 String GetRoot(); // New
 String GetTemp(); // New
      Possible new functions to change folders

```
class SysOS        // OS info. Samples after //
 String GetName(); // Windows  Linux
 String GetCode(); // 6.0    2.6.8-1.523
 String GetVersion(); // Vista    Ubuntu
 String GetRelease(); // Home Premium Edition 8.04
 String GetSize(); // 64-bit   32-bit

class SysCPU        //CPU info
 String GetIdentifier();
 String GetLevel();
 String GetRevision();
 String GetArchitecture;
 String GetSpeed();
 String GetNumber();
      Possible new functions to get more details

class SysProcesses       //Current processes info.
 bool Update();     // Gets processes info
 bool GetFirst(int processId, String pName);
 vool GetNext(int processId, String pName);
      Possible new functions to kill processes or change priority
```

I have seen in Upp that it tends to not create new classes with grouped static functions inside, but doing alone functions. What do you prefer ?

Best regards
Koldo

Quote:I have seen in Upp that it tends to not create new classes with grouped static functions inside, but doing alone functions.
This is a good point. I think it would be helpful to have functions grouped in some way. I have learned about the global function by just going one by one down the auto-complete assist++ list and reading the code on what those functions do. Some are self-explanatory, others are not. Most of them have simple intuitive names, but sometimes you need to do a search through all the functions to find the one you are looking for because assist++ matches from the beginning of the name. Though, in some ways, all those global functions have been very helpful because they

were right there for me to scroll to. I think the problem is going to come in as we keep adding more and more to global.

Subject: Re: More new functions

View Forum Message <> Reply to Message

Hello captainc

Thats it. In some cases is more than grouping functions indeed.
For example in the "SysCPU" functions related with the CPU info, the program gets all the information in one time so, for String GetSpeed() it will get all information for just getting the speed. As this information does not change while the program is running (CPU make, number, speed, etc), the class would gather all the info one time so the function would be like this:

SysCPU::GetSpeed() {return speed;};

In "SysProcesses" functions it is a little different as the processes info is something changing so we could have at the same cost two focus:
- class SysProcesses   //Current processes info.
 bool Update();   // Gets processes info
 bool GetFirst(int &processId, String &pName);
 vool GetNext(int &processId, String &pName);

or
- bool GetProcessesList(Array<int>&pid, Array<String>&name);

Best regards
Koldo

(P.D. Class and function names are just a proposal that you could change)

Hello all

Sorry for the delay. Now I am waiting for luzr final feedback about the structure of these functions.

After that I plan to have them ready (functions, a guy test and a text test) and tested for XP, Vista, Ubuntu 32 and 64 bits in two weeks.

In the second phase of about a month I want to test them with these free (as free beer) distros:
Mandriva, Open Suse, Gentoo and Knoppix, 32/64 bits, Intel/AMD64, Gnome/Kde/Xfce desktops.

This is because some of these functions have to identify the system accurately so they have to be tested with as many systems as possible.

Best regards
Koldo

I have a little question.

We are always speaking about xp, vista ubuntu 32 & 64 but what about xp and vista 64 ?
Does upp works well on these paltforms ?

koldo wrote on Thu, 30 October 2008 03:24Hello all

Sorry for the delay. Now I am waiting for luzr final feedback about the structure of these functions.

```
class SysFolders        // Special folders
 String GetDesktop();
 String GetPrograms();
 String GetAppData();
 String GetMusic();
 String GetPictures();
 String GetVideo();
 String GetPersonal();
```

String GetTemplates();
String GetDownload();

String GetRoot(); // New
String GetTemp(); // New
        Possible new functions to change folders

I think these should be in App.h, as global functions appended with "Path" or "Folder".

class SysOS   // OS info. Samples after //
String GetName(); // Windows Linux

I am not quite sure the merit of above.

String GetCode(); // 6.0   2.6.8-1.523

IMO we need something more comparable there. Maybe like puttint it into int64 as 4 16-bit fields or something like that? Or maybe just introduce "CompareVersion" function?

CompareVersion("2.4.5", "2.5.2") < 0

String GetSize(); // 64-bit   32-bit

What for?

class SysCPU   //CPU info
String GetIdentifier();
String GetLevel();
String GetRevision();
String GetArchitecture;
String GetSpeed();
String GetNumber();
        Possible new functions to get more details

Well, maybe... Anyway, I have a hard time imagining what are these good for beyond some fancy about box.

Still, not a bad idea to have it implemented.

class SysProcesses   //Current processes info.
 bool Update();   // Gets processes info
 bool GetFirst(int processId, String pName);
 vool GetNext(int processId, String pName);
        Possible new functions to kill processes or change priority

Yes, class for this one... The question is whether this belongs to Core. Most apps will not need this. But perhaps yes still.

Mirek

Subject: Re: More new functions
Posted by koldo on Fri, 31 Oct 2008 14:51:48 GMT

Hello luzr

I agree. I begin to work.

About SysOS and SysCPU:
- String GetName(); // Windows Linux

- I agree with your code:
CompareVersion("2.4.5", "2.5.2") < 0
- I will also include distro identification

Somebody could say that the user do know the OS, desktop, distro, cpu, etc. as it is his/her computer. But:
- Some info is interesting for the program itself, as knowing which desktop is installed
- In case of errors the program can do accurate reports to be sent to the developers.

But for SysCPU, I will reduce the number of functions...

I will also include this functions:

// I do not like this name. Perhaps:
//   GetExtProgram() or GetProgramFromExtension()
String GetExtExecutable(const char *ext);
bool LaunchFile(const String& file);

int LaunchCommand(const char *cmd, void (*readCallBack)(String &));
int LaunchCommand(const char *cmd, String &ret);

bool FileCat(const char *file, const char *appendFile);

Best regards
Koldo

View Forum Message <> Reply to Message

Instead of having these functions parted or just some of them i suggest to make a Sys package on bazaar and put in it all stuff that is related to, so who want to use CPU/OS/Version/etc may use that package easy and who doesn't need these functions doesn't have to worry about "bloating" his code... I think that's why Upp have a modular design, no? And that's why bazaar exist...

View Forum Message <> Reply to Message

Here it is!

I enclose you two folders:
- SysInfo: The package
---- SysInfo.cpp
---- SysInfo.h
---- SysInfo.upp
- SysInfo demo non-gui: A command line sample
---- main.cpp: The sample
---- SysInfo demo non-gui.upp

Finally I have included much more functions. Just run the demo program and play with it.

There are "SysInfo" functions and others, mainly because they were necessary. Please tell me the best way to organize them to be enclosed some in bazaar and some in other packages.

The next steps will be in addition to do a gui demo and to test the commands in more distros and OS as FreeBSD, OpenSolaris, Slackware and Knoppix. And of course to fix bugs and include more things if you want.

Best regards
Koldo

PD. I enclose you part of the program output as a sample:

Introduce enter or (l) to log off, (r) to reboot or (s) to shutdown
Introduce number of test cycles or just type enter to run it once:
SysInfo functions demo

#ifdef?

Mirek

Subject: Re: More new functions
Posted by koldo on Sun, 23 Nov 2008 15:20:33 GMT

View Forum Message <> Reply to Message

As you like!

In this case both #if defined(__MINGW32__) and #ifdef __MINGW32__ are equivalent.

If you prefer I will change all the #if defined to #ifdef.

The second is shorter but the first is a little richer. For example I think #if defined(x) || defined(y) is not possible with #ifdef.

Best regards
Koldo

Hello all

Here I enclose you an update with a fix to a problem in Kde that has been very hard for me to solve: in certain situations Kde console demo got an Xlib exception in situations covered by the program. This did not happened in Gnome or Xfce.

The solution has been as simple as including a dummy X11 error handler, as the program by itself manages the errors properly. As usual the solution came analyzing the Upp code.

Thank you for your comments. Please give me some feedback if the program works right and in which environments.

Best regards
Koldo

Hello all

I am very happy to show you the SysInfo testing results (see inclosed spreadsheet for details).
- If the distro is tested and all or almost all the functions run properly
- If I did not found a live CD to test the distro or I have had problems when running it that avoided me to test the SysInfo console demo

DISTROS AND O.S.
BSD
 Freesbie
GNU/Linux
 Fedora
 Fluxbox
 Gentoo
 Knoppix
 Kubuntu
 Mandriva
 Opengeu
 OpenSuse
 Slackware
 Slax (Slackware)
 Ubuntu (32 & 64 bits)
 Xubuntu
Windows
 Vista
 XP

DESKTOPS

Gnome
Kde
Xfce
Enlightenment
Fluxbox

In the inclosed SysInfo.zip you can find the source, the demo and the testing results including the log files and a spreadsheet table with the detailed results per distro.

For now the functions documentation is in the SysInfo.h file

SysInfo functions give information about:
- Special folders (Desktop, Download, Music, ...)
- System Info
- Memory Info
- Os Info
- Distro Info
- Default Exes
- Drives Info
- Launch File
- Find and Kill Window
- Windows List
- Process List

This functions do not require:
- To install additional programs. They do not have dependencies
- Super user permissions

If you want to use SysInfo and your distro/kernel is not in the list please try it. If some of the functions do not work please send me a post and I will try to solve it.

I will try to put this in Bazaar (now I do not know how)

In another post I will include new SysInfo functions I want to do. Ideas are acknowledged.

Best regards
Koldo

IMO, using / was not a best idea Also, mixing "not found a live CD" vs "problems" is not a good idea either...

I think we should have 3 lists - where it works, where it does not and where it was not tested.

Mirek

Ok

I will update it in next December release to be done in Bazaar.

Best regards
Koldo

Hello all

Added SysInfo and Automation libraries and samples in Bazaar (post http://www.ultimatepp.org/forum/index.php?t=msg&goto=197 76&#msg_19776).

Best regards
Koldo

It looks like GetAppDataFolder() returns empty string in some cases on Windows 7 (especially when run under debugger). Inner tracing shows that SHGetFolderPathW() returns <void>, and I don't know if it is good.

More of that, GetHomeDirectory() is more stable but returns poorly encoded value under Windows 7. In such cases, ToSystemCharset(GetHomeDirectory()) returns right value.
App encoding is UTF8, Win version is Win7 Ultimate Russian. User name is in russian characters. Local folders are default.

Hello Mindtraveller

In fact SHGetFolderPathW seems to be deprecated.
