Hello,

I have a class (window) AdvancedBrowser in which there are two classes bp1 and bp2. Both bp1 and bp2 contains a column list called slist.

The problem: when I press the ENTER key in the columnlist I would like to distinguish between the two in order to perform the appropriate action.

I've overridden the Key() method below. Unfortunately after I've clicked in both slist the key pressure return always the slist in bp1.

Is there a way to understand from where the key RETURN is pressed?

Thanks,  
Luigi

```
bool AdvancedBrowser::Key(dword key, int count)
{
    if(key == K_ENTER) {
        if (bp1.slist.IsCursor()) Exclamation("key bp1");
        else if (bp2.slist.IsCursor()) Exclamation("key p2");
        return true;
    }
    return TopWindow::Key(key, count);
}
```

The problem: when I press the ENTER key in the columnlist I would like to distinguish between the two in order to perform the appropriate action.

I've overridden the Key() method below. Unfortunately after I've clicked in both slist the key pressure return always the slist in bp1.

Is there a way to understand from where the key RETURN is pressed?

Thanks,  
Luigi

```
bool AdvancedBrowser::Key(dword key, int count)
```

```
{ if(key == K_ENTER) {  
    if (bp1.slist.IsCursor()) Exclamation("key bp1");  
    else if (bp2.slist.IsCursor()) Exclamation("key p2");  
    return true;  
}  
return TopWindow::Key(key, count);  
}
```

Solved.

It was necessary to remove with .KillCursor() the selection of the other columnlist.

Luigi
