
Subject: How to assign Fn-Key to button?

Hi!

How can I assign a Fn-Key, for example F5 on the keyboard, to a button in a dialog box? I want that the user can either press the button with the mouse or the corresponding Fn-Key.

I can assign accelerators with '&' in the label text, but I want to use Fn-Keys. I looked in the documentation, but couldn't find the right thing.

Any small hint is welcome.

Thanks

Zaurus

I don't think there is a direct way of doing this. What you do is overload the parent window's Key handler:

```
bool Key(dword key, int count) {  
    if (key == K_F5) {  
        button.PseudoPush();  
        return true;  
    }  
    return TopWindow::Key(key, count);  
}
```

Doing it this way also permits user-defined keys. I suggest you look at the reference/AK package or how to do this with very little effort. You basically just have to defined the keys then replace F5 with AK_whatever.

Thanks a lot. I was looking in references and examples, but I think due to staring to much at the screen did not see the AK reference.

So far I don't need to have it user-defined as I'm the only user. Just a small tool for my own use. But might be a good feature for some bigger applications.
